EDUCATION
▷ **Massachusetts Institute of Technology**, Cambridge, MA.
Ph.D. in Computational Fluid Dynamics, Department of Aeronautics and Astronautics, GPA 4.66 of 5.00, September 2008.

▷ **NASA Langley / George Washington University**, Hampton, VA.
Joint Institute for the Advancement of Flight Sciences M.S., Aeronautical Engineering, GPA 3.28 of 4.00, August 2000.

▷ **University of Southern California**, Los Angeles, CA.
B.S., Aerospace Engineering, GPA 3.48 of 4.00, May 1998.

RESEARCH INTERESTS
Computational Fluid Dynamics (CFD) flow and adjoint solver development for analysis, solution adaptation, and design; anisotropic grid adaptation mechanics; high-performance computing; CFD application; sonic boom prediction; collaborative software development.

SKILLS
C, Fortran, MATLAB, Ruby, Git, Subversion, GNU Autotools, LaTeX.

WORK EXPERIENCE
▷ **Research Scientist**, NASA Langley Computational AeroSciences Branch; September 2000–present. Implemented a three-dimensional output (adjoint) based error estimation and adaptation scheme in FUN3D.[1] Developed a parallel, anisotropic grid adaptation library that is developed test-first and contains a direct link to CAD geometry. Implemented Message Passing Interface (MPI) communication in FUN3D. Software manager for FUN3D and established the FUN3D distributed version control system with automated quarantine build and test for collaborative team software development. Supports numerous FUN3D users in government, industry, and academia with CFD consultation for sonic boom prediction, propulsion effects, ground vehicle performance, and grid adaptation. Provided the summary and statistical analysis of the AIAA Sonic Boom Predication Workshops as Co-chair, participant, and technical lead. Participated in the AIAA Drag Prediction, Supersonic Shock-Boundary Layer Interaction, and High Lift Prediction Workshops with output-adaptive grid methods. Performed turbulent eddy resolving calculations as part of the F-16XL Cranked-Arrow Wing Aerodynamics Project International (CAWAPI).

▷ **Research Assistant** Langley Multidisciplinary Optimization Branch; September 1998–August 2000. Applied the ADIFOR (Automatic Differentiation in FORTRAN) tool to CFL3D, a structured grid, Navier-Stokes CFD code for stability and control derivatives.

▷ **Co-op Flight Test Engineer** NASA Dryden Flight Research Center Aerodynamics, Propulsion, and Controls Branches; September 1995–August 1997. Improved air data reconstruction for F-18 HARV (High Alpha Research Vehicle). Supported the Linear Aerospike SR-71 Experiment (LASRE) with supersonic wind tunnel testing and computational flow solutions for stability and control prediction. Programmed a graphical modern control law design tool in MATLAB with application to the Hyper-X hypersonic free flyer. Explored alternative trajectories for Hyper-X booster and free flyer separation.
